

SPEECH RECOGNITION: THE BEST OF BOTH WORLDS

Switch from front-end to back-end mode anytime

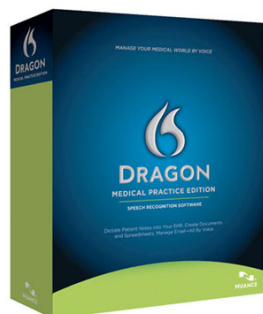

Front-end Speech Recognition allows you to:

- > Talk directly into your clinical system to add consultation notes and medication. This reduces typing time and related errors.
- > Save typing resources by creating your own referral letters. Simply print and sign them yourself once completed.
- > Navigate around your PC using voice commands rather than using the keyboard. Open your clinical system, research the web and send emails: all of this is possible using front-end speech recognition.
- > Save typing time and spend more with those who need you most: patients.

Back-end Speech Recognition allows you to:

- > Dictate and send your referral letters for typing as you would normally do with the DigiScribe-XL Dictation System.
- > Your dictated voice is recognised in the background and the corresponding text is passed on to the secretary along with the original voice file. Now all the secretary needs to do is correct the text (as opposed to typing it from scratch).
- > If you prefer you can correct your own letters later in the day to further save on secretarial resources.
- > Save hours of typing and eliminate spelling errors. The system learns the words you correct and gets them right every time after that.

Dragon Medical Practice Edition is 99% accurate 'out of the box' and includes a complete range of medical vocabularies.
